## DL5000 Meets the Challenges of Cutting Glass

Modern-day fabricators are facing new challenges with the increased use of glass mosaics and glass tile in today's fabrications. Diamond Tech, a leader in the tool industry, helps them meet these challenges with the **DL5000**.

*"I created an abstract countertop backsplash, 6 feet long by 18 inches high. The customer wanted the installation to be playful and wavy with lots of color intertwined - I used stained glass, gold smalti, millefiori and beads. Even though this type of installation was a change from my usual stone and tile installations, the DL5000 got me through it with outstanding results,"* states Emily Tholberg of Tholberg Mosaics.

Diamond Tech describes its **Diamond Laser 5000** as being able to cut through glass, tile, stone, and porcelain with ease, speed and comfort. The key, its three-wheel system, the top wheel assembly, pivots on a separate bearing with suppressors controlling its motion. By absorbing more vibration, the saw is capable of extremely effective blade-material contact with the blade tensioning knob directly connected to the top wheel assembly accurate adjustments can then be made.

Precision cutting is accomplished with a 61.5" diamond-coated steel blade; its technology is deeply entrenched in the world of stone and tile. The saw also features a 15" x 13" work surface and a "block and bearing" guide system which adjusts to the thickness of the material being cut. The **DL5000** saw also has the advantage of being portable. It weighs just 55 lbs., has its own carrying handle. The ½ hp variable-speed motor enables the user to cut through glass, granite and anything in between.
